

Equity Index Futures Trading Recommendations

11th April 2025

“Move LONG SPX on weakness”

Email: info@longvieweconomics.com

Trading Recommendation (‘1 – 2’ week equity index trading recommendation)

- Move $\frac{1}{4}$ LONG June S&P500 futures on weakness (at 5,006);
- Place stop loss at 4,780 (i.e. 4.5% below entry and below Monday’s intra-day low).

Rationale

US equities gave back some of their gains yesterday, following Wednesday’s historically large rally. In particular, the S&P500 closed down 3.5%, with larger losses in the NASDAQ100 (-4.2%) and Russell 2000 (-4.3%). The Philly SOX closed 8.0% lower (having rallied 18.7% on Wednesday). Equities therefore struggled, despite positive newsflow on US inflation (i.e. with the better than expected CPI print for March, table 1). Arguably, in that respect, equities were under pressure/troubled by the emerging signs of stress in the US Treasury market (e.g. with US 10 year yields up 40bps in the past four days, see FIG 1b).

Our view remains unchanged from yesterday. That is, US indices are in the midst of a relief rally (on a 1 – 2 week view). That’s the message of our short term models, which continue to generate clear BUY signals. In particular, our risk appetite models are mostly on BUY/strong BUY (FIGs 3 & 3a); portfolios are well protected to the downside (FIGs 3b & 3c); technical and price based indicators are on BUY/strong BUY (FIGs 3d, 3e, & 3f); while signs of fear/panic remain in place (e.g. with elevated VIX readings, see FIG 2).

Summarising those signals, and given the clear BUY message from medium term models, our combined ‘short plus medium term’ scoring system is still at low levels (i.e. on strong BUY, FIG 1).

Near term downside risks, though, are multiple. The bond market sell-off, for example, has the potential to create more volatility in equities (if it persists). Furthermore, our shortest term RAG indicator remains on SELL (and has generated timely signals in recent months, FIG 1c). As such, and given that daily price swings in US equities are currently large (FIG 1a), timing the entry point into LONG positions is key.

On balance, therefore, we favour moving LONG close to/just above Monday’s intra-day lows, with a (wide) stop loss below that intra-day low (see above for detailed recommendations). Other (two way) risks in markets are multiple and include US earnings season (with banks reporting today – see below for full list).

Kind regards,
The team @ Longview Economics

Table 1: Yesterday's US CPI report summary (March 2025)

Appendix: Model Explanations

Model 2a-b: Short term RAG1 & RAG2 (risk appetite gauge)

RAG1&2 each draw upon the volatility and price movement of approximately 70 financial instruments each day. By plotting risk curves we derive the risk appetite of the investment community as a whole on any and every day's trading in financial markets.

Model 2c: Shortest term RAG

This RAG model is a shorter term moving average risk appetite model than model 2a. By being shorter term in nature it helps to more accurately time the entry day for a specific trade.

Model 3a – 3b: Medium term RAGs

This is a medium term version of the risk appetite models. This is designed to forecast the direction of equity markets on a 1 – 2 month timeframe.

Model 3c: SELL-off indicator

The SELL-off indicator measures the number of days our RAG system has been on a SELL signal (i.e. as a positive number) and the number of days which it has been on a BUY signal (negative reading). When the indicator moves above +20 (i.e. risk appetite has been persistently high for a long period of time) this indicator warns of a potential sell-off in equity markets (and other risky assets). Most major SELL-offs in equity markets in recent years have been accompanied/foreshadowed by a reading of over +20.

Model 3d: CBOE put to call (deviation from trend model)

This model measures movements in the put to call ratio from its medium term moving average trend line. A sharp move higher (lower) in the put to call ratio indicates heightened levels of fear (complacency) and is used as a contrarian indicator. NB Given that the absolute put to call ratio has historically undergone long term structural trends, a deviation from trend model correlates more closely with medium term trends in equities.

Model 3e: Global volatility (deviation from trend model)

The (underlying) global volatility indicator measures the degree of complacency in financial prices. It achieves this by measuring short term realised volatility in over 150 financial assets from around the globe and across the asset class spectrum. A low reading indicates that only a low level of risk is priced into financial markets (and vice versa). Given, though, that volatility is an asymmetric measure of risk we use a deviation from trend version – which correlates more closely with trends in equities.

Model 3f: Momentum Model

Based on the rate of acceleration (or deceleration) of the momentum of the convergence (or divergence) of a short and a long term moving average of the equity or other price index. The concept is equally applicable to any financial market and the signals are particularly pertinent at extremes.

Model 3g: High yield corporate bond spreads (deviation from trend model)

This model measures movements in the spread of high yield corporate bonds over US Treasury yields from its moving average trend line. Given that the spread is an asymmetric measure of risk we use a deviation from trend version – which correlates more closely with trends in equities.

Model 3h: Colvin model

The Colvin model measures global market breadth i.e. the strength of the advance (or decline) in global risk asset prices. Extreme deviations from trend reflect rapid advances/declines in asset prices thereby leading to and generating overbought/oversold signals.
