

## Equity Index Futures Trading Recommendations

30<sup>th</sup> May 2025

“Short Term Models NEUTRAL/Mid-Range - WATCH & WAIT”

Email: [info@longvieweconomics.com](mailto:info@longvieweconomics.com)

### Trading Recommendation (‘1 – 2’ week equity index trading recommendation)

- WATCH & WAIT.

### Rationale

Newsflow has changed rapidly in the past 24 hours. On Wednesday evening, Trump’s ‘Liberation Day’ tariffs were found to be illegal (by the US Court of International Trade). Yesterday, though, that was overturned by a federal appeals court (which has granted a temporary stay ‘until further notice’).

Having opened sharply higher yesterday morning, therefore, equity markets gave back most of their gains later in the trading session. With that the S&P500 is currently back at around Wednesday’s close (and within its recent range – see FIG 1). The shape of the NASDAQ100 is similar (FIG 1a), while in Europe the DAX is back at the bottom of its range (see FIG 1b).

The initial moves in other global asset prices also faded yesterday. Gold and silver, for example, opened lower – i.e. they lost their safe haven bid on the positive tariff news. They then closed up, though, by ~1%. Conversely, the initial strength in OIL reversed, with Brent (-1.5%) and WTI (-2.3%) closing sharply lower on the day. US 10 year Treasury yields initially backed up (but ended the session lower/down 4bps).

On a closing price basis, the S&P500 has continued to track its 10 day moving average this week (having mostly traded above it/rallied sharply in April and May, see FIG 1c). The key question, therefore, is: **Will the uptrend resume in the near term?** Or, having recently lost momentum (since early last week), **are US equities about to roll over? Is the 50 day moving average the next short term target** (see FIG 1c)?

Our short term models remain broadly unchanged overnight, with most of them still NEUTRAL. Currently, therefore, they offer little insight into those questions. In particular our risk appetite, technical, breadth, and put to call models are all at mid-range levels. Those models are shown in FIGs 2 – 2f below.

For now, therefore, **we continue to favour WATCHing and WAITing** (i.e. for clearer signals from the models).

Please see below for a list of today’s key events and macro data, which include US personal income & spending (and headline & core PCE) for April (due at 1:30pm London time).

Kind regards,  
The team @ Longview Economics

## Key macro data/events

**Key data** today include: UK Lloyds business barometer (May, 12:01am); Japanese jobless rate (Apr, 12:30am); Japanese retail sales (Apr, 12:50am); Japanese industrial production (April first estimate, 12:50am); Australian private sector credit (Apr, 2:30am); Australian building approvals & private sector houses (Apr, 2:30am); Japanese housing starts (Apr, 6am); Japanese housing starts (Apr, 6am); **Eurozone M3 money supply** (Apr, 9am); Italian GDP (Q1 final estimate, 9am); **Spanish CPI** (May first estimate, 9am); **Italian headline CPI** (May first estimate, 10am); Italian PPI (Apr, 11am); **German headline CPI** (May first estimate, 1pm); **US personal income & spending including headline & core PCE** (Apr, 1:30pm); Canadian GDP (Mar, 12:30pm); US wholesale sales & inventories (Apr, 1:30pm); US Chicago PMI (May, 2:45pm); US Michigan Sentiment (May final estimate, 3pm).

**Key events** today include: Speeches by the ECB's Panetta in Rome (9:30) & Vujcic in Dubrovnik; The Fed's Logan takes part in a Q&A (1:25am).

**Key earnings** today include: N/A

## Definitions & other matters:

RAG = Risk Appetite Gauge

The 'Daily Risk Appetite Gauge' publication is designed to generate '1 to 2' week trading recommendations on equity indices. For trading recommendations on currencies, rates, bonds and other assets, pls see Macro-TAA trade publications.

For a medium-term recommendation please see our '1 – 4' month tactical market views which are updated at the start of each month in our Tactical Equity Asset Allocation publication (as well as occasional ad-hoc intra month Tactical Alerts). The latest update was published last week on 19<sup>th</sup> May 2025. If you are not on the distribution list and would like to receive these reports pls email [info@longvieweconomics.com](mailto:info@longvieweconomics.com).

## Appendix: Model Explanations

---

### **Model 2a-b:** Short term RAG1 & RAG2 (risk appetite gauge)

RAG1&2 each draw upon the volatility and price movement of approximately 70 financial instruments each day. By plotting risk curves we derive the risk appetite of the investment community as a whole on any and every day's trading in financial markets.

### **Model 2c:** Shortest term RAG

This RAG model is a shorter term moving average risk appetite model than model 2a. By being shorter term in nature it helps to more accurately time the entry day for a specific trade.

### **Model 3a – 3b:** Medium term RAGs

This is a medium term version of the risk appetite models. This is designed to forecast the direction of equity markets on a 1 – 2 month timeframe.

### **Model 3c:** SELL-off indicator

The SELL-off indicator measures the number of days our RAG system has been on a SELL signal (i.e. as a positive number) and the number of days which it has been on a BUY signal (negative reading). When the indicator moves above +20 (i.e. risk appetite has been persistently high for a long period of time) this indicator warns of a potential sell-off in equity markets (and other risky assets). Most major SELL-offs in equity markets in recent years have been accompanied/foreshadowed by a reading of over +20.

### **Model 3d:** CBOE put to call (deviation from trend model)

This model measures movements in the put to call ratio from its medium term moving average trend line. A sharp move higher (lower) in the put to call ratio indicates heightened levels of fear (complacency) and is used as a contrarian indicator. NB Given that the absolute put to call ratio has historically undergone long term structural trends, a deviation from trend model correlates more closely with medium term trends in equities.

### **Model 3e:** Global volatility (deviation from trend model)

The (underlying) global volatility indicator measures the degree of complacency in financial prices. It achieves this by measuring short term realised volatility in over 150 financial assets from around the globe and across the asset class spectrum. A low reading indicates that only a low level of risk is priced into financial markets (and vice versa). Given, though, that volatility is an asymmetric measure of risk we use a deviation from trend version – which correlates more closely with trends in equities.

### **Model 3f:** Momentum Model

Based on the rate of acceleration (or deceleration) of the momentum of the convergence (or divergence) of a short and a long term moving average of the equity or other price index. The concept is equally applicable to any financial market and the signals are particularly pertinent at extremes.

### **Model 3g:** High yield corporate bond spreads (deviation from trend model)

This model measures movements in the spread of high yield corporate bonds over US Treasury yields from its moving average trend line. Given that the spread is an asymmetric measure of risk we use a deviation from trend version – which correlates more closely with trends in equities.

### **Model 3h:** Colvin model

The Colvin model measures global market breadth i.e. the strength of the advance (or decline) in global risk asset prices. Extreme deviations from trend reflect rapid advances/declines in asset prices thereby leading to and generating overbought/oversold signals.
