

Equity Index Futures Trading Recommendations

10th October 2024

"CPI day - Volatility Likely to be High" Email: info@longvieweconomics.com

Trading Recommendation ('1 – 2' week equity index trading recommendation)

WATCH & WAIT

Rationale

US equity markets continued to rally yesterday from the bottom of their recent trading range, eventually breaking out to the upside. That rally started overnight Monday night and continued through Tuesday and into Wednesday's trading session. With that, S&P500 futures posted a new intraday record high of 5,846.5 (just above the prior high of 5,830.0 on 26th September – FIG 1c). NDX100 futures, meanwhile, are back at the top end of their recent consolidation range (i.e. pushing on the 20,538.0 intraday highs on 26th Sept).

Of note, US CPI data is released later today (1:30pm London time; 8:30am EST). As always (along with non-farm payrolls), this US macro data can generate noteworthy intraday volatility. Interestingly, in that respect, US interest rate futures/expectations have moved sharply since last week's stronger than expected jobs data. Since last Thursday's close, for example (i.e. the day before the payrolls data), the market has priced out 38bps of rate cuts by the end of 2025 (FIG 1). The number of the cuts for the remainder of this year has also moderated (FIG 1 – see Dec 2024 implied rate). With that, 1, 2 and 10 year US bond yields have all picked up sharply. Ten-year yields closed at 4.06% yesterday (up from 3.74% at the start of the month).

In terms of models, the **medium-term SELL case remains and continues to strengthen**. Overnight the SELL-off indicator has reached +19 (i.e. just shy of its key +20 level at which it warns of a heightened risk of a wave of risk aversion – FIG 1a); the combined medium term risk appetite model is on SELL (FIG 1b): while the (medium term) level of downside put protection is low (i.e. markets are vulnerable to negative newsflow and not hedged to the downside).

Short term models, however, have drifted lower in the past few trading sessions, highlighting the potential for this breakout to run for a few more trading sessions (before they get back onto SELL). Those models are laid out in FIGs 2 to 2e.

Having (just) been stopped out yesterday and given the potential two-way volatility that's likely as a result of the CPI data release today, we **recommend sitting on the sidelines for now**. Other key important forthcoming events include the Chinese fiscal stimulus announcement which is scheduled for this coming Saturday (12th October). A full list of today's key events is shown below.

Kind regards,

The team @ Longview Economics

Key macro data/events

Key data today include: Japanese PPI (Sept, 12:50am); Japanese bank lending (Sept, 12:50am); **RICS house price balance** (Sept, 12:01am); German retail sales (Aug, 7am); Italian industrial production (Aug, 9am); **US headline & core CPI** (Sept, 1:30pm); US weekly jobless claims (1:30pm).

Key events today include: Speech by the RBA's Hunter at Macquarie University (8:45am); speeches by the Fed's Barkin in Fireside chat (3:30pm) & Williams at Binghamton University (4pm).

Key earnings today include: Progressive, Delta Air Lines, Domino's Pizza Inc, Fast Retailing, Seven & i Holdings.

Definitions & other matters:

RAG = Risk Appetite Gauge

The 'Daily Risk Appetite Gauge' publication is designed to generate '1 to 2' week trading recommendations on equity indices. For trading recommendations on currencies, rates, bonds and other assets, pls see Macro-TAA trade publications.

For a medium-term recommendation please see our '1-4' month tactical market views which are updated at the start of each month in our Tactical Equity Asset Allocation publication (as well as occasional ad-hoc intra month Tactical Alerts). The latest update was published last week on 3^{rd} October 2024. If you are not on the distribution list and would like to receive these reports pls email info@longvieweconomics.com.

Appendix: Model Explanations

Model 2a-b: Short term RAG1 & RAG2 (risk appetite gauge)

RAG1&2 each draw upon the volatility and price movement of approximately 70 financial instruments each day. By plotting risk curves we derive the risk appetite of the investment community as a whole on any and every day's trading in financial markets.

Model 2c: Shortest term RAG

This RAG model is a shorter term moving average risk appetite model than model 2a. By being shorter term in nature it helps to more accurately time the entry day for a specific trade.

Model 3a – 3b: Medium term RAGs

This is a medium term version of the risk appetite models. This is designed to forecast the direction of equity markets on a 1-2 month timeframe.

Model 3c: SELL-off indicator

The SELL-off indicator measures the number of days our RAG system has been on a SELL signal (i.e. as a positive number) and the number of days which it has been on a BUY signal (negative reading). When the indicator moves above +20 (i.e. risk appetite has been persistently high for a long period of time) this indicator warns of a potential sell-off in equity markets (and other risky assets). Most major SELL-offs in equity markets in recent years have been accompanied/foreshadowed by a reading of over +20.

Model 3d: CBOE put to call (deviation from trend model)

This model measures movements in the put to call ratio from its medium term moving average trend line. A sharp move higher (lower) in the put to call ratio indicates heightened levels of fear (complacency) and is used as a contrarian indicator. NB Given that the absolute put to call ratio has historically undergone long term structural trends, a deviation from trend model correlates more closely with medium term trends in equities.

Model 3e: Global volatility (deviation from trend model)

The (underlying) global volatility indicator measures the degree of complacency in financial prices. It achieves this by measuring short term realised volatility in over 150 financial assets from around the globe and across the asset class spectrum. A low reading indicates that only a low level of risk is priced into financial markets (and vice versa). Given, though, that volatility is an asymmetric measure of risk we use a deviation from trend version – which correlates more closely with trends in equities.

Model 3f: Momentum Model

Based on the rate of acceleration (or deceleration) of the momentum of the convergence (or divergence) of a short and a long term moving average of the equity or other price index. The concept is equally applicable to any financial market and the signals are particularly pertinent at extremes.

Model 3g: High yield corporate bond spreads (deviation from trend model)

This model measures movements in the spread of high yield corporate bonds over US Treasury yields from its moving average trend line. Given that the spread is an asymmetric measure of risk we use a deviation from trend version – which correlates more closely with trends in equities.

Model 3h: Colvin model

The Colvin model measures global market breadth i.e. the strength of the advance (or decline) in global risk asset prices. Extreme deviations from trend reflect rapid advances/declines in asset prices thereby leading to and generating overbought/oversold signals.
